

# Arbor Networks

## Продуктовая линейка SP/TMS

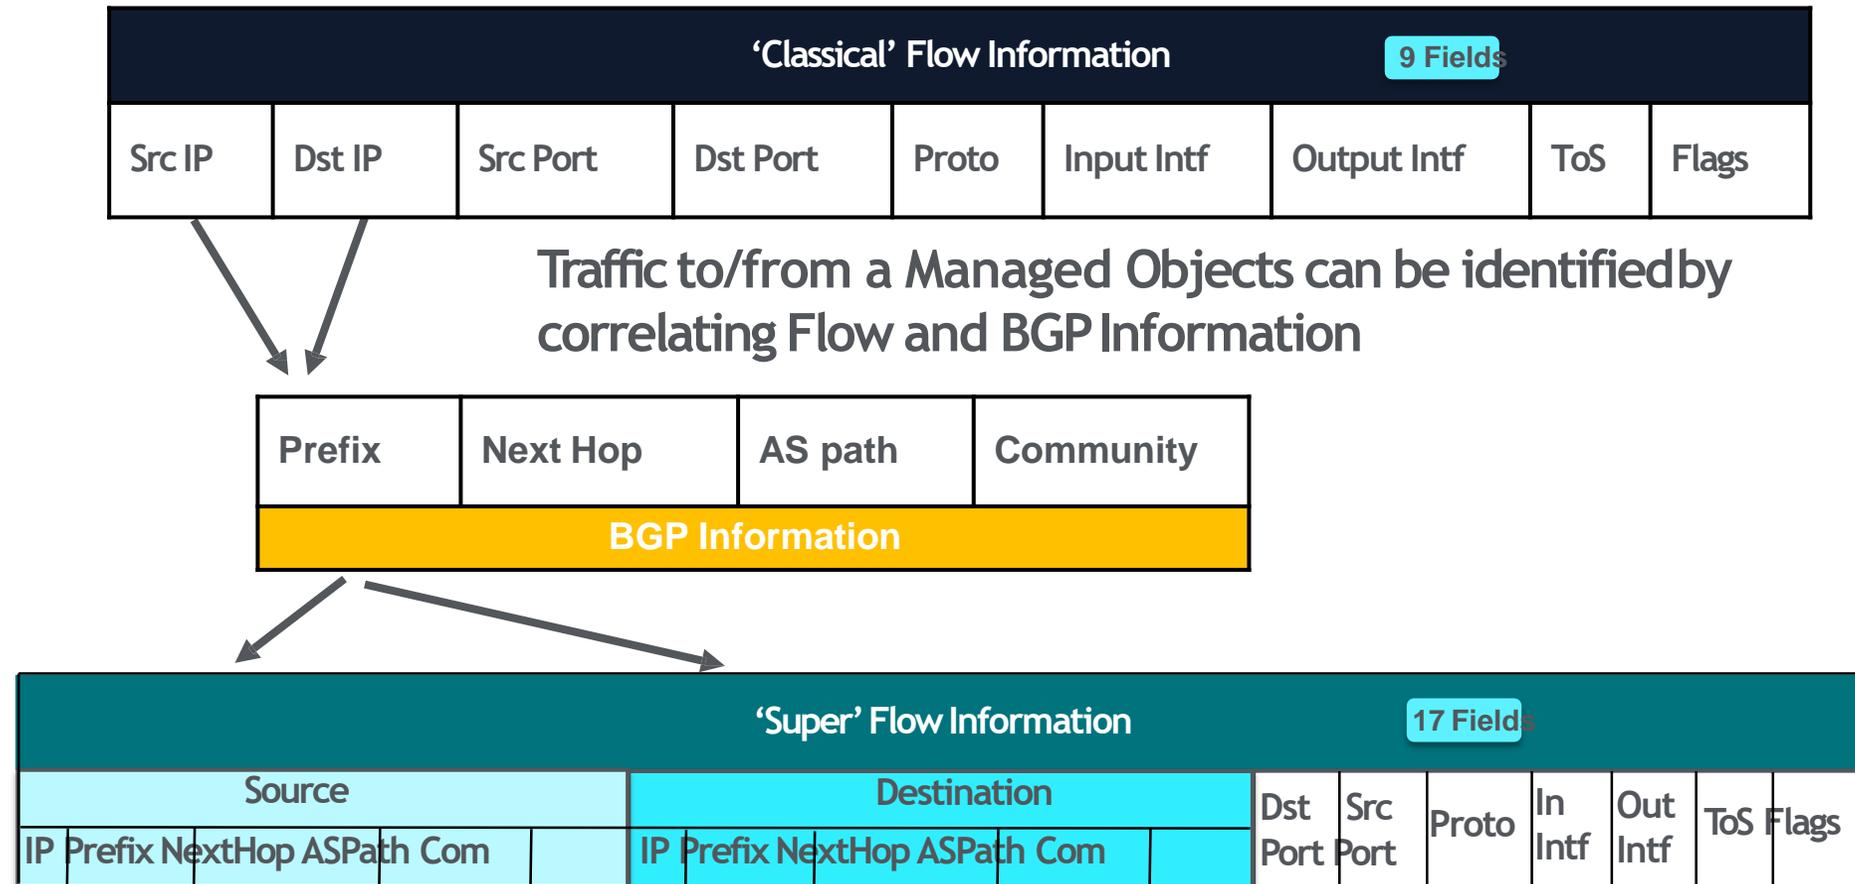

# Визуализация – Знай свою сеть

- Какой трафик в моей сети?
- Как он меняется со временем?
- Где узкие места в моей сети?
- Где нужно нарастить емкость каналов?
- Какова загрузка моих ресурсов?
- Как мне спланировать маршрутизацию?
- К какому оператору лучше подключиться?
- Как растет IPv6 трафик в моей сети?
- Есть ли у меня IPv6 туннели?

# Насыщение FLOW

SP does a longest match on source IP and destination IP of the flow to the prefixes in BGP routes

# Визуализация = Arbor SP

- 350+ преднастроенных отчетов
  - Возможность создавать «свои» отчеты
- WEB Портал
  - 700 одновременных пользователей (20к в БД)
  - Разграничение прав доступа (Radius/Tacacs)
- Отчеты для начальства (Executive reports)
  - Вся сеть в одном отчете.
- Atlas Global DDoS Report
  - Глобальное состояние мира DDoS за последний месяц
  - Создается ASERT
  - Данные из ATLAS

# Автоматизация ключ к успеху

- Подход “Fast Flood”
  - Время появления сигнала о DDoS атаки от 1 секунды (10 - 15 секунд в среднем)
- Авто – Митигация
  - Автоматическое перенаправление трафика на систему очистки при атаке
  - Молниеносное подавление атаки
- Автоматический Offload FlowSpec фильтров на маршрутизаторы
  - Маршрутизаторы «становятся» системами очистки с огромной емкостью
- Rest API
  - Цель: достигнуть паритета между функционалом WEB UI и REST API
  - Дополнительная гибкость, высокий уровень кастомизации, дополнительный функционал и отчеты, возможность интеграции с различными внешними системами

# Архитектура SP/TMS

## Коллекторы Телеметрии

- Визуализация трафика, проходящего через Peering/Transit/Backbone, выявление аномалий и угроз
- Возможность мониторинга трафика клиентов на границе сети (Edge)

## Система очистки трафика

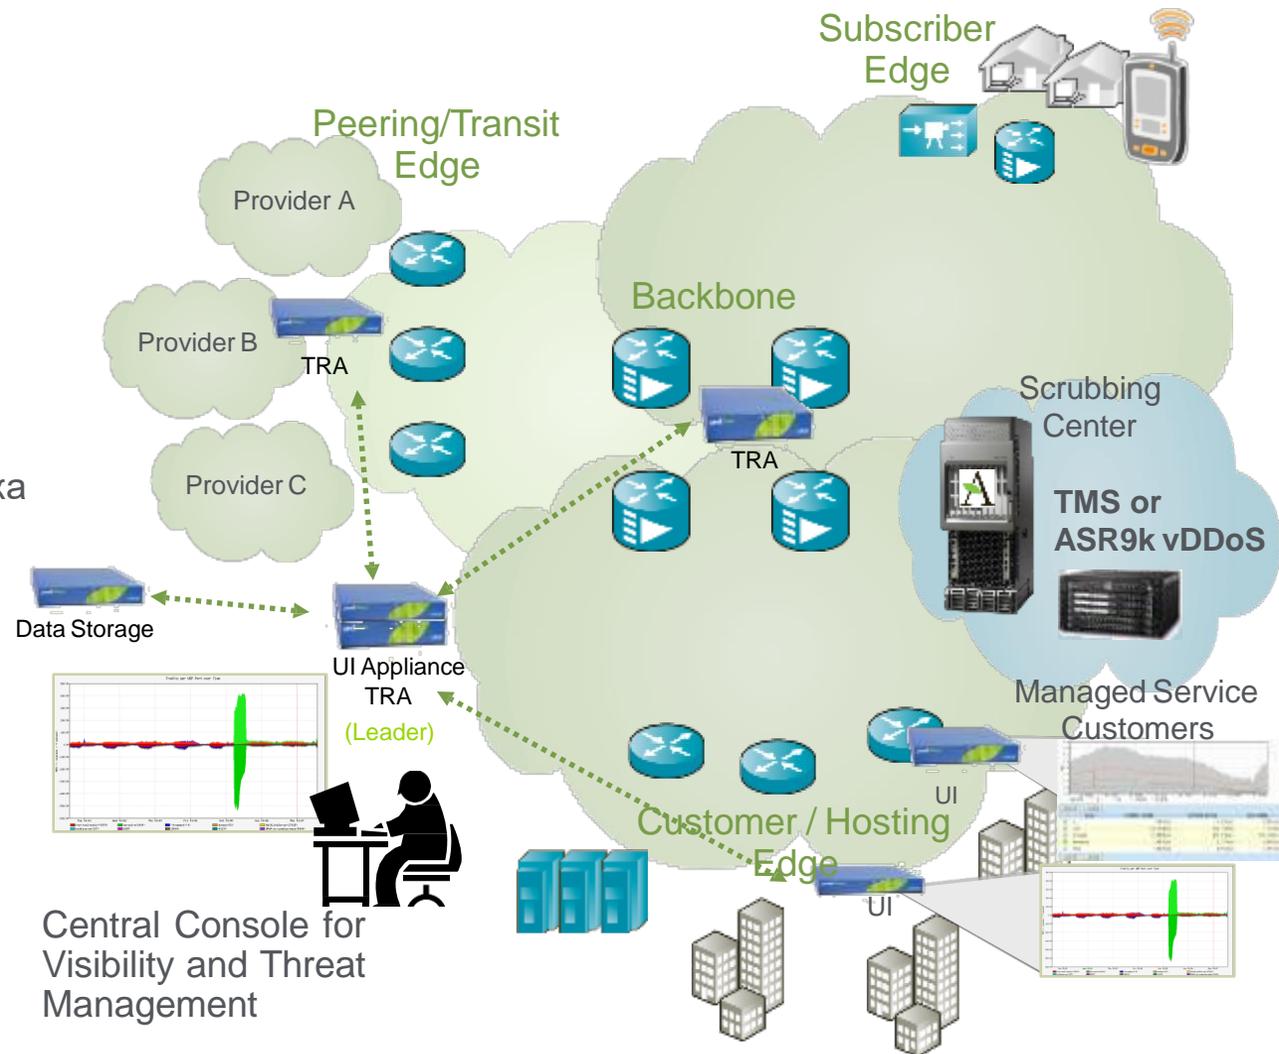

“Хирургическое” выделение зловредного трафика

## Объекты мониторинга

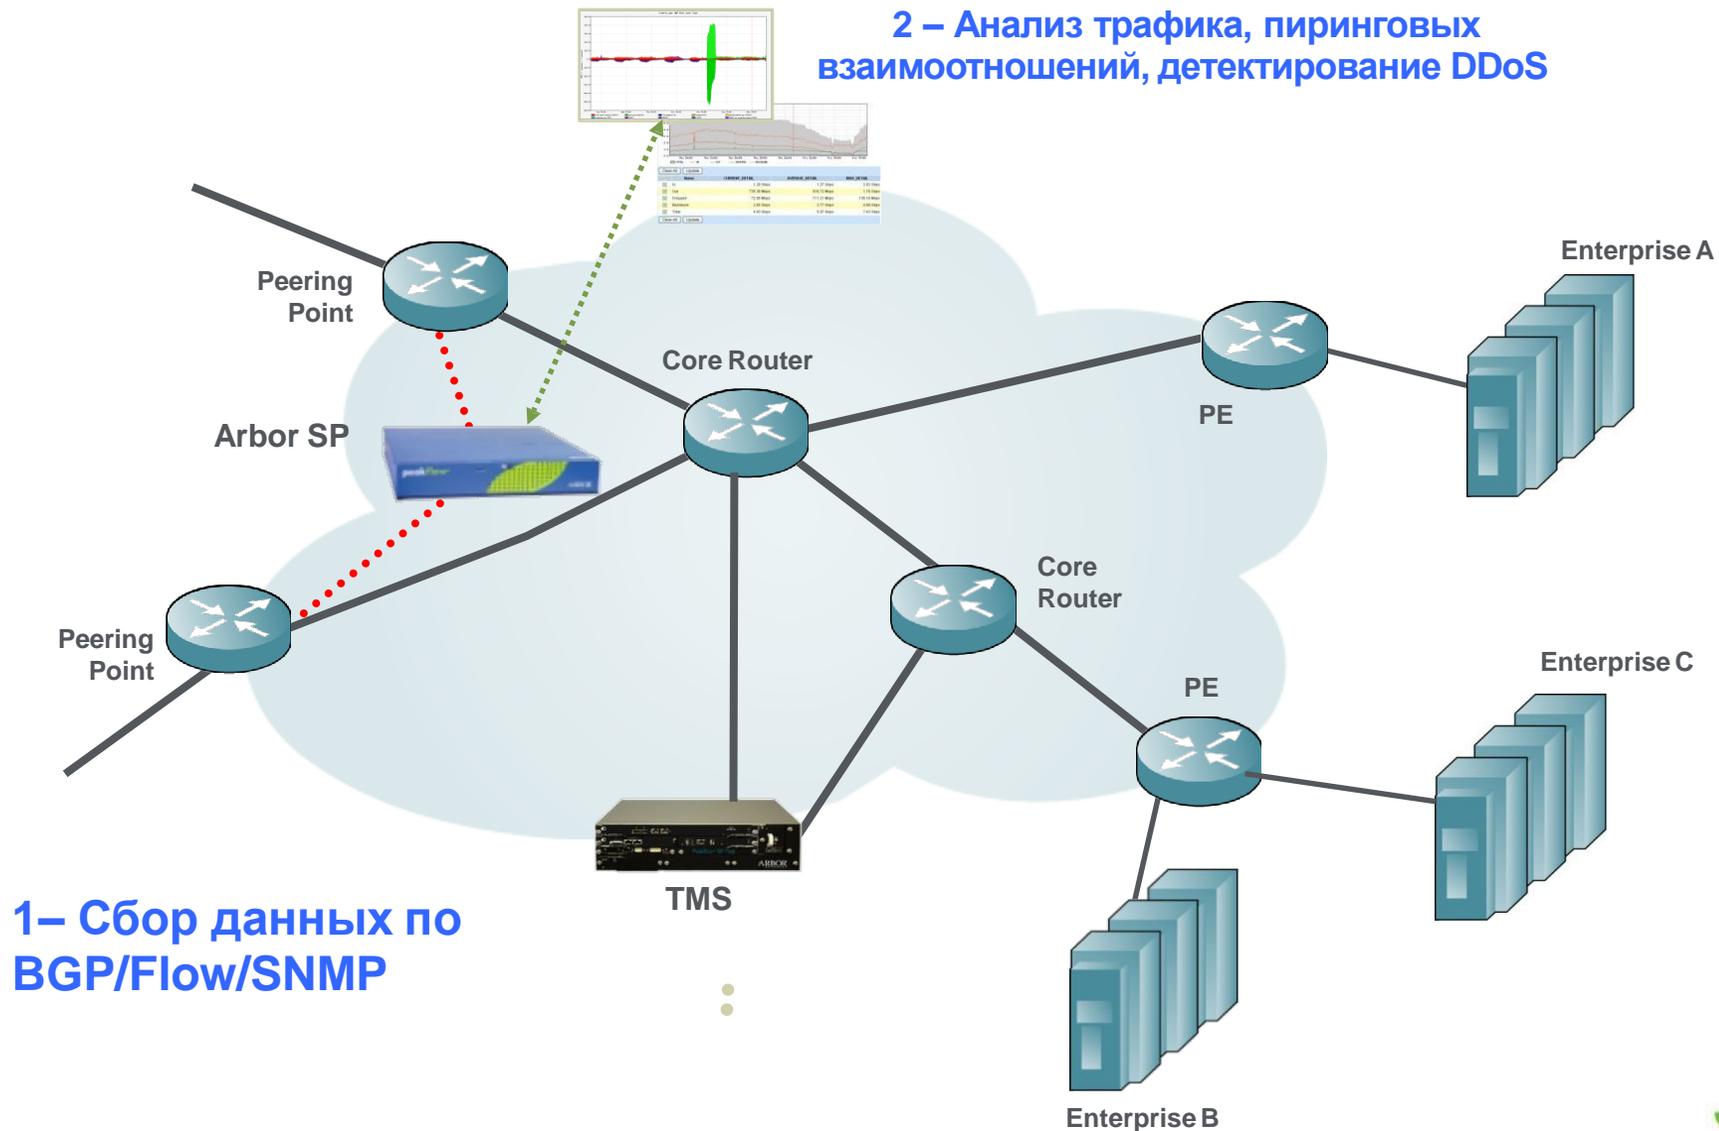

- Масштабирование объектов мониторинга
- Multihoming

## Графический Интерфейс (API)

- Контроль количества одновременных сессий WEB UI
- API удобный инструмент мониторинга и экспорта информации

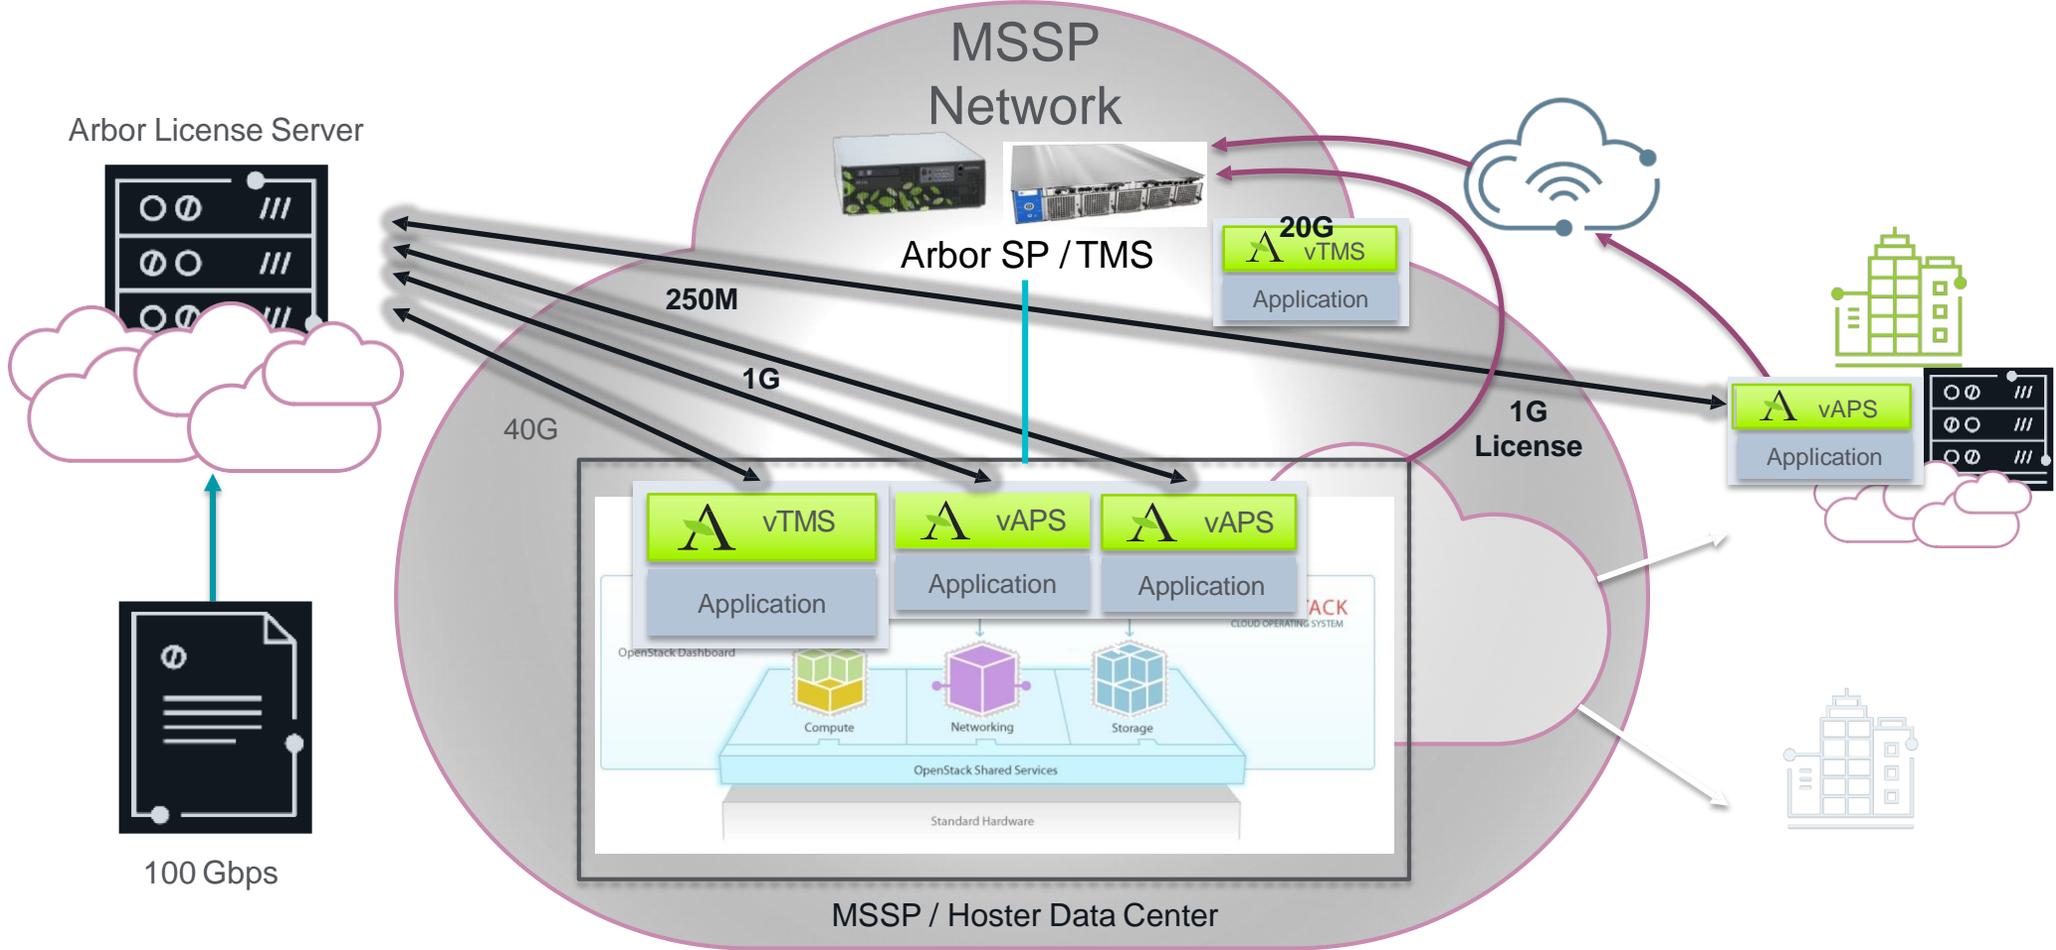

# Как работает SP/TMS

# vTMS licensing

# Новый функционал SP/TMS

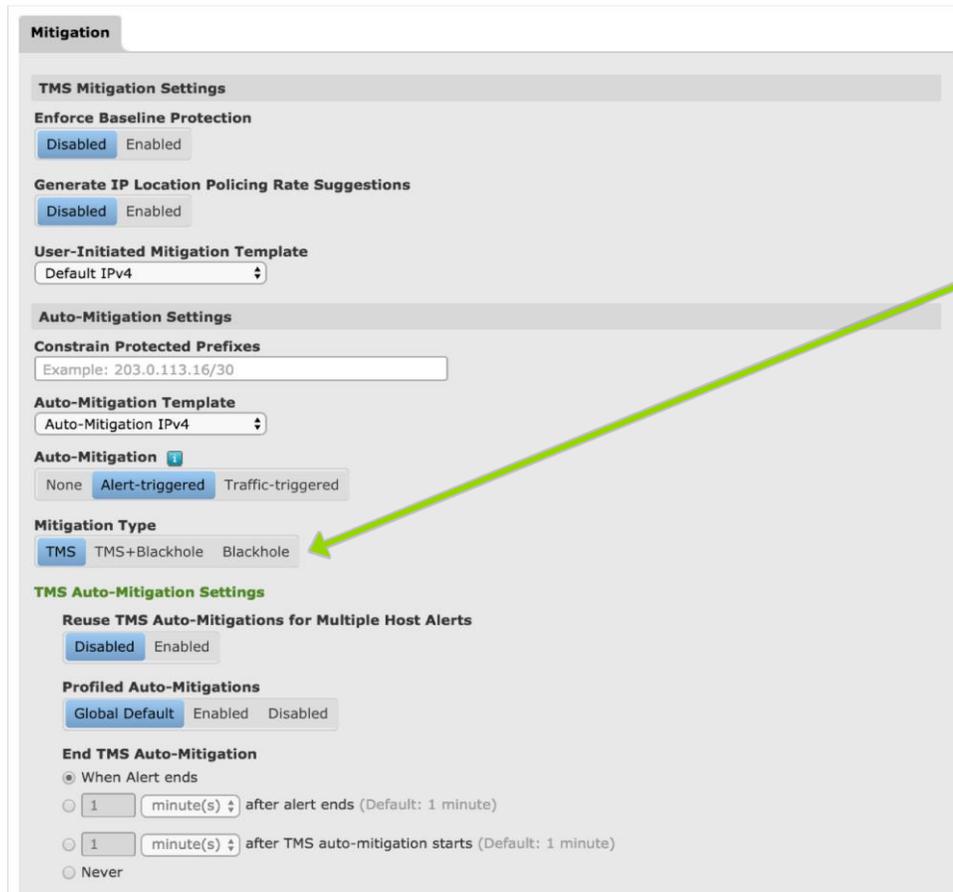

# Blackhole Auto-Mitigation

## 8.0

- Arbor SP blackhole mitigations are designed for TMS mitigations to handle attacks until overall traffic threatens to exceed:
  - TMS capacity of customer site
  - Uplink/downlink capacity of customer site
- Arbor SP also supports blackhole mitigations as a defense for customers without TMS
  - Not surgical
  - Takes attack target offline
  - Arbor suggest that they use TMS

# Blackhole Auto-Mitigation

## 8.0

**Mitigation**

**TMS Mitigation Settings**

**Enforce Baseline Protection**

**Generate IP Location Policing Rate Suggestions**

**User-Initiated Mitigation Template**  
Default IPv4

**Auto-Mitigation Settings**

**Constrain Protected Prefixes**  
Example: 203.0.113.16/30

**Auto-Mitigation Template**  
Auto-Mitigation IPv4

**Auto-Mitigation**

**Mitigation Type**

**TMS Auto-Mitigation Settings**

**Reuse TMS Auto-Mitigations for Multiple Host Alerts**

**Profiled Auto-Mitigations**

**End TMS Auto-Mitigation**  
 When Alert ends  
 1 minute(s) after alert ends (Default: 1 minute)  
 1 minute(s) after TMS auto-mitigation starts (Default: 1 minute)  
 Never

- TMS
  - Host alert triggers TMS mitigation
- Blackhole
  - Host alert triggers blackhole mitigation
- TMS+Blackhole
  - Host alert triggers TMS mitigation
  - TMS traffic triggers blackhole mitigation

# Blackhole Auto-Mitigation

## 8.0

- Each mitigation type has independent *End* settings

*End TMS Auto-Mitigation conditions*

*End Blackhole Auto-Mitigation conditions*

The screenshot displays the 'Auto-Mitigation Settings' configuration page. Key sections include:

- Constrain Protected Prefixes:** A text input field with an example of '203.0.113.16/30'.
- Auto-Mitigation Template:** A dropdown menu set to 'Default IPv4'.
- Auto-Mitigation:** Radio buttons for 'None', 'Alert-triggered' (selected), and 'Traffic-triggered'.
- Mitigation Type:** Radio buttons for 'TMS', 'TMS+Blackhole' (selected), and 'Blackhole'.
- TMS Auto-Mitigation Settings:**
  - Profiled Auto-Mitigations:** 'Global Default' (selected), 'Enabled', and 'Disabled' buttons.
  - End TMS Auto-Mitigation:** Radio buttons for 'When Alert ends' (selected), 'after alert ends (Default: 1 minute)', 'after TMS auto-mitigation starts (Default: 1 minute)', and 'Never'. Each has a '1' minute input field.
- Blackhole Auto-Mitigation Settings:**
  - Incoming TMS Traffic Threshold to Begin Blackhole Auto-Mitigation:** Fields for 'Bytes' (with 'bps' unit) and 'Packets' (with 'pps' unit).
  - Community:** A dropdown menu with a 'Lookup a Community Group' link. Below are checkboxes for 'Local AS', 'No advertise', 'No export', and 'No peer'.
  - IPv4 Nexthop:** Radio buttons for 'Null Route', 'Diversion', and 'Custom' (selected). Below is a 'Custom Nexthop' input field with an example of '192.168.1.2'.
  - IPv4 Router BGP Sessions:** A dropdown menu labeled 'Select IPv4 Router BGP Sessions...'.
  - End Blackhole Auto-Mitigation:** Radio buttons for 'When Alert ends' (selected), 'after alert ends (Default: 1 minute)', 'after Blackhole auto-mitigation starts (Default: 1 minute)', and 'Never'. Each has a '1' minute input field.

# TMS Auto-mitigation Reuse

8.0

**Edit Appliance "anchor"**

- Appliance
- SNMP
- Deployment
- ArborFlow
- Patch Panel
- Subinterfaces
- Ports
- IPv4 GRE
- IPv6 GRE
- Advanced**

**Advanced**

**Maximum Ongoing Mitigations**

Lowering the maximum number of ongoing mitigations allows more state to be kept per mitigation.

**CAUTION:** Changing this setting briefly interrupts packet processing while SP reconfigures the TMS appliance. Arbor recommends that you only change this setting when there are no running mitigations.

**Maximum Ongoing Mitigations** (Default: 50)

Range: 10 - 100

**Hardware Blacklisting**

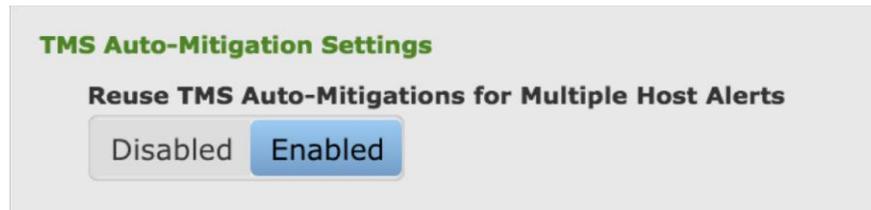

**Block on**

Source  Source+Mitigation

# TMS Auto-mitigation Reuse

## 8.0

- New option to reuse an auto-mitigation for multiple host detection alerts

- Configured per Managed Object
  - Available for alert-triggered TMS auto-mitigations only
  - **Not available for TMS+Blackhole auto-mitigations**
- Reduces the number of TMS auto-mitigations when many hosts are under simultaneous attack

# Новые типы Host Detection

- 8.2:

- TCP ACK
- TCP SYN/ACK
- L2TP
- mDNS
- NetBIOS
- RIPv1
- rpcbind

- 8.4:

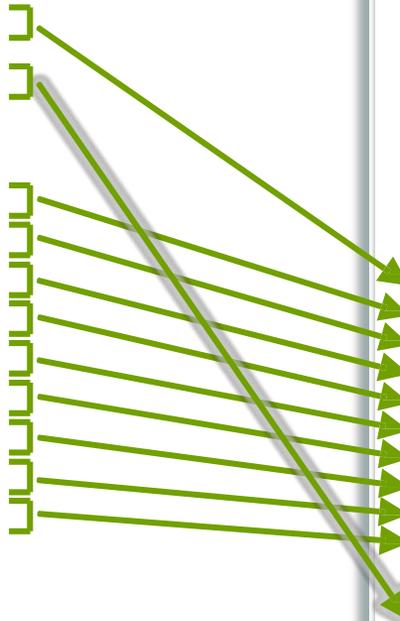

- C-LDAP
- memcached

# Автоматизация очистки Amplification атак

## SP/TMS 8.2

# Redirect IPv4/IPv6 с помощью FlowSpec

## SP 8.1/8.3

- TMS IPv4/IPv6 mitigations support flowspec diversion to TMS
  - Only with diversion via SP peering announcements
- Redirect traffic to route target or an IPv4/IPv6 address
- Feature parity with IPv4 flowspec diversion to TMS

**Flow Specification Diversion**

The default route target or IP address for a TMS group overrides the default route target or IP address for all TMS appliances in the group.

IPv4 Redirect To

Example: 203.0.113.33:100, 64496:100, 65536L:100

IPv6 Redirect To

Example: 203.0.113.33:100, 2001:db8:aa::1124:100, 64496:100, 65536L:100

Community

Example: 6543:3453 129:874

Local AS  
 No advertise  
 No export  
 No peer

# FlowSpec offload

- Makes the router a part of MITIGATION system
- Offload FlowSpec filters to router
- Blocks BULK traffic

The screenshot shows the 'Edit Flow Specification' interface for a rule named 'Drop UDP'. The top navigation bar includes 'System', 'Alerts', 'Explore', 'Reports', 'Mitigation', and 'Administration'. The 'Mitigation' menu is open, showing options like 'All Mitigations', 'Long-Term Statistics', 'Threat Management', 'Flow Specification', and 'Blackhole'. The 'Filter' tab is selected, and the 'Destination' field is set to '1.1.0.2/32'. Other fields include 'Protocol Numbers' (17), 'Source Prefix', 'Source Ports', 'Destination Ports', 'ICMP Type', 'ICMP Code', 'TCP Flags', 'Packet Lengths', 'DSCP', and 'Fragment' (2). The 'Match any specified source ports AND any specified destination ports' option is selected. At the bottom, there are 'Cancel' and 'Save' buttons.

The screenshot shows the 'Action' configuration for the 'Drop UDP' rule. The 'Action' tab is selected, and the 'Action' field is set to 'discard traffic-rate'. There are 'Cancel' and 'Save' buttons at the bottom.

# FlowSpec Automitigation

## SP 8.4

The screenshot shows the Arbor Networks administration interface. The top navigation bar includes 'Administration', a PDF icon, an email icon, and 'Help'. The main navigation menu is on the left, with 'Mitigation' selected. The 'Mitigation' submenu is expanded, showing the following options: Templates, AIF Templates, TMS Groups, TMS-CGSE Clusters, TMS-ISA Clusters, Filter Lists, Global Settings, Community Groups, Blackhole Nexthops, and IPv4 Flowspec Auto-Mitigation Settings.

The screenshot shows the 'Misuse Types' configuration page. A note at the top states: "Note: The default values for these parameters are listed in the [User Guide](#)." Below the note is a table with columns 'Enabled' and 'Misuse Type'. The table lists various misuse types with checkboxes indicating their status.

Enabled	Misuse Type
<input type="checkbox"/>	Total Traffic
<input checked="" type="checkbox"/>	chargen Amplification
<input checked="" type="checkbox"/>	CLDAP Amplification
<input type="checkbox"/>	DNS Amplification
<input type="checkbox"/>	IP Fragmentation

## Global Summary September 2018

**Highlights:**

- ISPs: 351
- Routers: 6752
- Attacks: 551 k
- Peak Volume: 637 Gbps
- Peak Speed: 188 Mpps
- Peak Duration: 33 days (32 days, 14 hours)
- Top Attack Types: Total Traffic, UDP, IP Fragmentation

**ISPs by region:**

- NAMER: 109
- LATAM: 40
- EMEA: 152
- APAC: 54
